No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /SIDS1/gcgdata/geneseq/geneseqn-emb1/NA2001B.DAT:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             300
                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a DNA sequence encoding the heavy chain variable region of primate monoclonal antibody anti-human CD23 5E8. The invention provides primate monoclonal antibody anti-human CD23 5E8 bind human CD23, the low affinity receptor for IgE (FCeRii/CD23), and comprise either of a human gamma-1 or human gamma-3 constant region that binds to human Fc gamma receptors and inhibits 1gB expression. The monoclonal antibodies of the invention are claimed to be useful for inhibiting induced IgE production for treating or preventing for inhibiting and autoimmune conditions e.g. allergic rhinitis conjunctivitis, autoimmune hameolytic anaemia, etc.

This is the nucleotide sequence of novel target plasmid Mandy.

The plasmid includes an inactivated murine dihydrofolate reductase (DHRR) gene, the Escherichia coll beta-galactosidase gene, baculovirus DNA, a casette comprising the promoter and enhancer elements from cytomegalovirus and SV40 virus, the E. coli heta-glucuronidase (GUS) gene, firefly luciferses gene, an inactivated Salmonella typhimurium histidinol dehydrogenase (HisD) gene and transposon This neowycin phosphotransferase (neo) gene sequences, in a pBR-derived backbone, and also an anti-human CD23 igs receptor human gamma-1 monoclonal antibody 5E8 gene. The invention provides a novel method for integrating a desired invention provides a novel method for integrating desired invention provides a target site within the genome of a mammalian cell with a 'marker plasmid' such as Deemond (see AAV61782), which contains a unique sequence that is foreign to the mammalian cell with a warker plasmid, such as Deemond (see AAV61782), which contains a unique sequence that is foreign to the mammalian cell ollowed by transfection with a 'target plasmid', such as Mandy or Molly (see AAV61793), containing a sequence which provides for homologous recombination with the unique sequence which provides for homologous recombination system utilises the neo gene as a communant selectable marker. The neo gene is split into 3 exons. Exon 3 is present on the marker plasmid and becomes integrated into the mammalian cells, the marker plasmid into the mammalian cells split into 3 exons. Exon 3 is present on the marker plasmid and 2 are present on the marker plasmid and 2 least one of interest is cloned. Homologous recombination with the unique sequence which the contraction of the marker is cloned. Homologous recombination and are separated by an intron into which at the barder of interest is cloned. Homologous recombination and are separated by an interning a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mammalian cells, and can be used to express any type of recombinant protein. The use of a triply spliced selectable marker means that all selected colonies arise from homologous recombination. In addition, the number of colonies that need to be screened to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of the targeting vector with the integrated marking vector results in correct splicing of all 3 exons of the neo gene and expression of a functional neo protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel human monoclonal antibodies. The antibodies can bind to human Tumour Growth Factor-beta (TGF-beta) II receptor, resulting in the inhibition of the signal transduction of human TGF-beta into cells. The antibodies can be used for the prevention and treatment of diseases associated with the production of TGF-beta, such as tissue fibrosis in the lung, liver, skin, kidney or other tissues, atherosclerosis, atopy, keloid and arthritis. The present sequence was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ij,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for screening an antibody, comprising performing 2-D electrophoresis on plural proteins in a sample. Individual protein spots are separated by reacting them with an antibody library and then replicating the bound antibodies before reacting them with the spot proteins again. The method is useful for screening an antibody specific for a target protein, e.g. from a phage antibody library, which is useful in proteomics for studying various protein and complementary deoxyribonucleic acid (cDMA) expression libraries as well as gene functions, and in other biological and medical sciences. This polynucleotide is a DNA sequence relating to the antibody screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

The method is used for the identification of an objective protein. The present sequence is a DNA sequence for an antibody chain (derived from the DP47 heavy chain, the DPK22 light chain or a combination of the two) used in the method of

Individual proteins are separated by reacting them with an antibody library and then replicating the bound antibodies before reacting them with the spot proteins again. The method is useful for screening an antibody specific for a target protein, e.g. from a phage antibody library, which is useful in proteomics for studying various protein and complementary decayribonucle acid (CDNA) expression libraries as well as gene functions, and in other biological and medical sciences. This polynucleotide is a DNA sequence relating to the antibody screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening antibody; 2-D electrophoresis; plural protein; protein spot; antibody library; proteomics; ds.
                                                                             Screening an antibody using 2-D electrophoresis on plural proteins in samples for separating individual protein spots to react with an antibody library useful in proteomics and other biological sciences -

The method comprises contacting a repercoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in

The present invention describes a dual-specific ligand (I) comprising:

(a) a first single immunoglobulin variable domain with a binding specificity to a first antieve.

(a) second complementary immunoglobulin single variable domain with a binding activity to a second antigen or epitope. The binding domains are mutually complementary, and the first and second domains lack mutually complementary domains that share the same specificity. (I) has cytostatic, anti-HIV, antianaemic, antiinflammatory, immunosuppressive and neuroprotective activities. The dual-specific ligand is useful for treating, preventing or diagnosing inflammations or autoimmune disorders (e.g. multiple sclerosis, Crohn's disease or myasthenia gravis). The dual-specific ligand may be used to recruit cytotoxic T-cells to a cancer cell. The dual-specific ligand is also useful for monitoring the efficacy of drugs, as well as for monitoring toxicity. The present sequence encodes a human serum albumin (HSA) related antibody sequence, which is used in an example from the
                                                                         Dual-specific ligand having immunoglobulins with binding specificity different antigens or epitopes, useful for treating, preventing or diagnosing diseases, e.g. cancer, HIV infection, inflammations, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 720 BP; 168 A; 181 C; 214 G; 157 T; 0 other;

The interaction features to a method of initizating tumour growth factor receptor (VEGFR) antagonists in combination with radiation, chemotherapeutic agent, or epidermal growth factor receptor (EGFR) antagonists. The method is useful for inhibiting tumour growth in a human, where the tumour (e.g. tumour of the breast, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, head and neck, ovary, prostate, brain, pancreas, skin, bone marrow, blood, thymus, uterus, testicles, cervix or liver) over expresses VEGFR. It is also useful for inhibiting growth of colon tumour or non-small cell lung carcinoma (NSCLC) and tumour overexpressing EGFR. It is preferably useful for treating subjects with both solid tumours, preferably useful tumours and non-solid tumours, preferably high vascular tumours and non-solid tumours. The inhibition of the progression of tumour includes prevention or inhibition of the progression of tumour includes the invasiveness, metastasis, recurrence and increase in size of the tumour. The present sequence is tumour KDR (VEGFR-2) Fab antibody heavy chain DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 TCCTGTGCAGCCTCTG----GATTCACCTTCAGTAGCTATAGCATGAACTGGGTCCGC 114

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel antibody having a first antigen binding stee specific for a first vascular endothelial growth factor (VEGF) receptor and a second antigen-binding site specific for a second VEGF receptor. The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF-induced cellular functions such as mitogenesse of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TGGTGCGCAGCCTCCGGGTTCAGGTTCACCTTCAATAACTACTACATGGACTGGGTCCGC 120

invention relates to screening an antibody against a specific protein
                                                                                                                                                                                                      in an objective structure sample containing a protein group in high efficiency, comprising reacting an objective structure sample containing as protein group or a portion containing an objective protein in the sample with an antibody library, recovering the antibody combined with the protein, replicating the recovered antibody and reacting it with the objective protein at least once. The method is used for the identification of an objective protein. The present sequence is a DNA sequence for an antibody chain (derived from the DP47 heavy chain, the DPK22 light chain or a combination of the two) used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for screening an antibody, comprising performing 2-D electrophoresis on plural proteins in a sample. Individual protein spotes are separated by reacting them with an antibody library and then replicating the bound antibodies before reacting them with the spot proteins again. The method is useful for screening an antibody specific for a target protein, e.g. from a phage antibody library, which is useful in proteomics for studying various protein and complementary decoxyribonucleic acid (CDNA) expression libraries as well as gene functions, and in other biological and medical sciences. The invention relates to a method of inhibiting tumour growth which involves administering, vascular endothelial growth factor receptor (VEGFR) antagonists in combination with radiation, chemotherapeutic agent, or epidermal growth factor receptor (EGFR) antagonist. The method is useful for inhibiting tumour growth in a human, where the tumour (e.g. tumour of the breast, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, heart, uterius, testicles, cervix or liver) over expresses VEGFR. It is also useful for inhibiting growth of colon tumour or non-small cell lung carcinoma (NSCLC) and tumour overexpressing EGFR. It is preferably useful for treating subjects with both solid tumours, preferably high vascular tumours and non-solid tumours. The inhibition of treduction of tumour growth includes prevention or inhibition of the progression of tumour, including cancerous and non-cancerous tumours, where the progression of tumours includes the invasiveness, metaatasis, recurrence and increase in size of the tumour. The present sequence is human KDR (VEGFR-2) Fab antibody heavy chain DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    234
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel antibody having a first antigen binding site specific for a first vascular endothelial growth factor (VEGF) receptor and a second antigen-binding site specific for a second VEGF receptor. The bispecific antigen-binding proteins block activation of VEGF receptor and are useful for reducing or inhibiting VEGF-induced cellular functions such as mitogenesis of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This polynucleotide sequence represents a human DNA sequence relating to the bispecific antibodies that bind to the VEGF receptors of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CTGTATCTGCAAATGAACAGCCTGAGAGCCGAGGACACGGCTGTGTATTACTGTGCGAGA 294

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of inhibiting tumour growth which involves administering, vascular endothelial growth factor receptor (VEGFR) antagonists in combination with radiation, chemotherapeutic agent, or epidermal growth factor receptor (EGFR) antagonist. The method is useful for inhibiting tumour growth in a human, where the tumour (e.g. tumour of the breast, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, head and neck, ovary, prostate, brain, pancreas, skin, bone marrow, blood, thymus, uterus, testicles, cervix or liver) over cxpresses VEGFR. It is also useful for inhibiting growth of colon tumour or non-small cell lung carcinoma (NSCLC) and tumour overexpressing EGFR. It is preferably useful for treating subjects with both solid tumours, correcteduction of tumour growth includes prevention or inhibition of the progression of tumour including cancerous and non-cancerous tumours, where the progression of tumours includes the invasiveness, metastasis, recurrence and increase in size of the tumour. The present sequence is human KDR (VEGFR-2) Fab antibody heavy chain DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TGGTACGCAGACTCCGTGAAGGGCAGATTCACCATCTCCAGAGAAACGCCAACAACACA 240

                                                                                                                                                                                                                                                                                                          Sequence 11, Application US/09273839A

Sequence 11, Application US/09273839A

Patent No. 632916

GENERAL INFORMATION:

APPLICANT: Cirino, Nick M

APPLICANT: Jehnert, Bruce E

TITLE OF INVENTION: Disruption of Anthrax Toxin Binding to Cell Surface

TITLE OF INVENTION: Receptors

FILE REFERENCE: S-89,662

CURRENT APPLICATION NUMBER: US/09/273,839A

CURRENT PILING DATE: 1999-03-22

NUMBER OF SEQ ID NOS: 12

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 11

LENGTH: 892

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1, Apsequence 1, Apsequence 1, Asequence 1, Asequence 23, Sequence 27, Sequence 20,

Application US/09192854

Patent No. US20020068276A1

GENERAL INFORMATION:

APPLICANT: Winter, Greg

TITLE OF INVENTION: Methods for Selecting Functional Peptides

TILE REPERENCE: 3789/72916

CURRENT APPLICATION NUMBER: US/09/192,854

CURRENT PEPLING DATE: 1998-11-17

EARLIER APPLICATION NUMBER: 60/066,729

SARLIER PILING DATE: 1997-11-21

NUMBER OF SEQ ID NOS: 212
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 411;

Sequence 30. Application US/10091300
Publication No. US20030108545A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Rockwell, Patricia
APPLICANT: Goldstein, Neil I.
ITILE OF INVENTION: Combination Methods of Inhibiting Tumor Growth With a Vascular
ITILE OF INVENTION: Endothelial Growth Factor Receptor Antagonist
FILE REFERENCE: 11245,46211
CURRENT APPLICATION NUMBER: US/10/091,300
CURRENT FILING DATE: 2002-03-04
NUMBER OF SEQ ID NOS: 85
SOFTWARE: WordPerfect 8.0 for Windows
